Abstract
Environmental hazards, unsustainable use of natural resources, biodiversity loss, climate change, and resource-related conflicts are severe threats to sustainable development and peaceful coexistence in Nigeria. Although existing measures focus on environmental legislation, innovative technologies, and institutional reforms, philosophical and ethical considerations may contribute to the discourse by emphasising the values that underpin the relationships between people and their environments. This position paper seeks to explore Daoist philosophy as an ethical framework that could help Nigeria to achieve environmental protection, sustainable development, and peaceful coexistence by reviewing the concepts of Dao (the Way), ziran (naturalness), wu wei (non-forcing action), pu (the uncarved block), humility, moderation, and harmony. By discussing the themes of ecological restoration, sustainable consumption, environmental education, communal participation, and nonviolent conflict resolution, this paper will demonstrate how Daoist environmental ethics could complement Nigeria's efforts to develop strategies for environmental stewardship, conservation, and protection. Since Nigeria is a culturally and environmentally diverse country with various indigenous worldviews, this position paper will argue that Daoist philosophy needs to be contextualised in Nigeria by building upon local ecological knowledge, environmental traditions, institutions, and communities. Furthermore, this paper will suggest that philosophical ideas should be used alongside scientific research, environmental legislation, democratic reforms, and ecological literacy to promote sustainability, social justice, and peace. By recommending the integration of ecological ethics in environmental education, community participation in environmental governance, responsible

production and consumption patterns, institutional accountability, and environmental research, this paper will demonstrate that Daoist philosophy is a valuable framework for cultivating ecological stewardship, conservation, and protection in Nigeria.

Keywords: Daoist philosophy, environmental protection, environmental ethics, sustainable development, peaceful coexistence, Nigeria

Introduction

Environmental degradation is a major challenge to sustainable development since human survival, economic productivity, public health, and social well-being rely on the functionality of ecological systems. Deforestation, biodiversity loss, pollution, excessive resource extraction, and climate change threaten the capacity of natural systems to support present and future generations. These problems have prompted environmental philosophers to question anthropocentric assumptions that treat nature primarily as an instrument for satisfying human demands. Daoist environmental thought offers an alternative perspective by challenging rigid divisions between humanity and nature and encouraging greater sensitivity to ecological relationships and the processes through which life flourishes (Cooper, 2014; Miller, 2017). Environmental protection consequently requires not only scientific and technological solutions but also ethical reflection on the responsibilities associated with human activities.

Nigeria faces interconnected environmental challenges that affect livelihoods, agricultural productivity, public health, and community stability. Oil pollution in the Niger Delta, deforestation, erosion, flooding, land degradation, biodiversity loss, and inadequate waste management illustrate the complexity of environmental governance in the country. The United Nations Environment Programme (UNEP, 2011), for example, documented extensive petroleum contamination in Ogoniland and identified the need for comprehensive remediation and institutional action. Such challenges demonstrate that environmental protection depends on effective regulation, scientific monitoring, responsible industrial practices, public participation, and institutional accountability. They also raise ethical questions concerning the distribution of environmental costs, the responsibilities of resource-extracting industries, and the protection of communities whose livelihoods depend on healthy ecosystems (UNEP, 2011; United Nations, 2015).

Sustainable development provides an important framework for addressing these challenges because it requires attention to economic advancement, social well-being, environmental integrity, and the interests of future generations. The World Commission on Environment and Development (1987) established the widely accepted principle that development should meet present needs without compromising the ability of future generations to meet their own needs. Similarly, the United Nations (2015), through the 2030 Agenda for Sustainable Development, connects sustainable consumption and production, ecosystem protection, climate action, and peaceful, inclusive societies. These objectives require more than economic planning: they also require values and institutions that discourage irresponsible exploitation and ensure that development decisions account for long-term ecological and social consequences (United Nations, 2015; World Commission on Environment and Development, 1987).

Daoist philosophy offers a potentially useful ethical contribution to this challenge. Associated particularly with the classical texts Dao De Jing and Zhuangzi, Daoism emphasises living in accordance with the Dao, recognising naturalness (ziran), practising non-forcing action (wu wei), and avoiding excessive ambition and control (Laozi, 2003; Zhuangzi, 2009). These concepts challenge the assumption that human beings can manipulate natural systems without consequences. Cooper (2014) explains that Daoism's relevance to environmental philosophy does not depend on rejecting technology or advocating a return to primitive living; rather, it involves reconsidering how human life can become more responsive to nature. Moeller (2015) similarly identifies non-anthropocentrism, wu wei, and ziran as important themes in Daoist philosophy. These ideas provide a basis for critically examining environmentally destructive practices and promoting more responsible relationships between society and nature (Cooper, 2014; Moeller, 2015).

Contemporary scholarship has further explored the possibilities and limitations of interpreting Daoist philosophy through environmental ethics. Miller (2017) argues that Daoism offers perspectives on the relationship between human flourishing and the natural world, while Zhang (2023) explains that ziran and wu wei can be reconstructed as an environmental ethic without reducing them to passive acceptance of ecological destruction. Nevertheless, Daoism emerged within a different historical and cultural context from Nigeria's, and its concepts cannot simply be transferred into Nigerian society without critical interpretation. Their application must account for Nigeria's diverse religious traditions, indigenous ecological knowledge, environmental legislation, socioeconomic inequalities, and specific ecological conditions (Miller, 2017; Zhang, 2023).

This paper therefore advances the position that Daoist philosophy and principles can serve as complementary ethical tools for environmental protection, sustainable development, and peaceful coexistence in Nigeria. It examines the philosophical foundations of Daoism, analyses the relevance of its principal concepts to Nigerian environmental challenges, considers the relationship between ecological responsibility and social peace, and proposes practical measures for integrating relevant principles into environmental education and governance. The central argument is that Daoist philosophy can strengthen existing environmental interventions when critically adapted to local realities and supported by scientific evidence, enforceable laws, institutional accountability, and environmental justice (Cooper, 2014; United Nations, 2015; Zhang, 2023).

2. Statement of the Problem

Nigeria's environmental challenges reveal a persistent gap between the recognition of environmental problems and the effective implementation of measures to prevent or control ecological damage. Although environmental policies and regulatory institutions exist, weaknesses in enforcement, inadequate public participation, institutional fragmentation, and implementation difficulties can undermine environmental protection. Ogunkan (2022), in a review of environmental governance in Nigeria, identifies institutional and legal weaknesses and limited stakeholder participation as important barriers to sustainable environmental management. These challenges suggest that effective environmental protection requires not only stronger governance structures but also ethical commitments that encourage responsibility, transparency, and cooperation among governments, industries, and communities (Ogunkan, 2022; United Nations Environment Programme [UNEP], 2011).

A further concern is the tendency to prioritise immediate economic benefits over long-term ecological integrity. Unsustainable resource extraction, inappropriate land-use practices, excessive consumption, and pollution can impose environmental costs on communities that depend on healthy ecosystems for agriculture, fishing, water supply, and other livelihood activities. The environmental assessment of Ogoniland illustrates the serious consequences that prolonged pollution can have for water, land, vegetation, public health, and community well-being (UNEP, 2011). Daoist philosophy provides a basis for questioning excessive exploitation and encouraging moderation, humility, and greater sensitivity to the relationships between human activities and natural systems (Cooper, 2014; Miller, 2017).

Environmental degradation may also contribute to social tensions when communities compete over land, water, forests, and other natural resources or perceive environmental damage and resource allocation to be unfair. Nevertheless, environmental pressure does not automatically produce violent conflict; the outcomes depend on political institutions, inequality, livelihood conditions, resource governance, and opportunities for peaceful dispute resolution (Intergovernmental Panel on Climate Change [IPCC], 2022). Daoist principles of non-forcing action, humility, and harmony may provide useful ethical guidance for dialogue and cooperation, but their contribution must be accompanied by legal accountability, fair resource allocation, and protection of the rights of affected communities (Cooper, 2014; Zhang, 2023).

The central problem addressed by this paper is therefore how Daoist philosophy can be critically adapted to complement existing environmental governance approaches in Nigeria. The paper examines whether principles associated with naturalness, moderation, responsive action, and harmony can provide ethical support for environmental education, ecological restoration, sustainable development, and peaceful coexistence without replacing scientific evidence, environmental legislation, or institutional reform (Miller, 2017; Ogunkan, 2022; Zhang, 2023).

3. Aim and Objectives of the Paper

The aim of this paper is to examine Daoist philosophy and principles as complementary ethical tools for environmental protection, sustainable development, and peaceful coexistence in Nigeria. This aim is grounded in scholarship that identifies potential environmental implications in Daoist concepts while recognising the importance of translating philosophical ideas into context-sensitive practical approaches (Cooper, 2014; Miller, 2017; Zhang, 2023). The specific objectives are to: a). examine the philosophical foundations of Daoism and identify principles relevant to environmental ethics, b). analyse the potential application of Daoist principles to environmental protection and sustainable development in Nigeria; c). explain how Daoist ethical principles may contribute to environmental justice, conflict prevention, and peaceful coexistence; d). identify the cultural, conceptual, and institutional limitations associated with applying Daoist philosophy in Nigeria; e). propose strategies for integrating relevant Daoist principles into environmental education, public policy, and community-based environmental governance. This distinguishes the paper as a philosophical and motivational work rather than an empirical one claiming to have quantified the effects of Daoist intervention in Nigeria. This is an important difference since philosophical arguments can create ethical possibilities, while assertions about actual environmental or social outcomes would require systematic empirical investigation (Cooper, 2014; Ogunkan, 2022).

4. Methodology

The study was designed using a qualitative conceptual framework founded upon extensive philosophical and documentary analyses. The research data were collected from Daoist's classical sources, peer-reviewed articles, journals, books, and environmental policies and reports. The literature was searched using Google search, Scopus, and Web of Science. The research technique utilized was the critical evaluation of the extracted information. The themes were centered around Dao, Wu Wei, Ziran, Moderation, and Harmony. The relevance and relationship of these themes to environmental protection, sustainable development, governance, and peaceful co-existence in Nigeria were evaluated. The research findings were further authenticated by critically comparing the philosophical texts and contemporary environmental information (Jaakkola, 2020).

5. Conceptual and Philosophical Foundations

5.1. Understanding Daoist philosophy

Daoism, also known as Taoism, is a Chinese philosophical and religious tradition particularly associated with the Dao De Jing and Zhuangzi. Its philosophical themes include Dao, naturalness, non-forcing action, the limitations of rigid conceptual distinctions, and the importance of responding appropriately to changing circumstances. The tradition encompasses various interpretations and historical developments, and it should not be reduced to a single environmental doctrine or a simple instruction to leave nature untouched (Laozi, 2003; Moeller, 2015; Zhuangzi, 2009). The concept of Dao, often translated as the Way, refers to the underlying way or process through which things arise, transform, and relate to one another. Daoist thought challenges the assumption that human beings stand entirely outside nature as independent controllers of an otherwise passive world. Miller (2017) suggests that Daoist philosophy can inspire a relational understanding of human existence in which human flourishing is connected to the flourishing of the wider natural world. In the context of environmental protection, however, this perspective offers an ethical reason to consider the ecological relationships and long-term consequences associated with development choices (Laozi, 2003; Miller, 2017).

5.2. Daoist environmental ethics

Environmental ethics explores the moral responsibilities of human beings towards the natural world, including questions of ecological value, resource use, conservation, and obligations to future generations. Daoist philosophy contributes to this discourse by challenging excessive human domination and encouraging attentiveness to the processes through which natural systems operate. Classical Daoist texts, however, were not written as contemporary environmental policy manuals, and their present-day environmental implications should be read through the lens of interpretation and critical reconstruction (Cooper, 2014; Zhang, 2023). The relevance of Daoist environmental ethics to Nigeria lies in its capacity to complement existing scientific, legal, cultural, and institutional approaches. Its principles could inspire ethical guidance for evaluating development priorities, encouraging restraint in resource exploitation, and encouraging more responsive environmental decision-making. Their practical application, however, must be evaluated in light of ecological evidence, social justice, and Nigeria's specific environmental circumstances rather than assumed to yield beneficial outcomes automatically (Miller, 2017; Ogunkan, 2022; Zhang, 2023).

6. Major Daoist Principles and Their Environmental Significance

6.1. Dao: Living in accordance with the Way

The principle of Dao promotes an understanding of existence that acknowledges transformation, interdependence, and the limitations of rigid human control. In environmental philosophy, this perspective challenges approaches that see forests, rivers, soils, and other natural resources as isolated commodities without considering their relationships with wider ecological systems. Cooper (2014) and Miller (2017) argue that the relationship between Daoist thought and nature is a significant foundation for rethinking human responsibility toward the environment (Cooper, 2014; Miller, 2017). In Nigeria, an interpretation of Dao as an ethic of ecological interdependence would guide integrated watershed management, forest conservation, agricultural planning, and urban development. Flood management should consider drainage infrastructure alongside land-use patterns, wetlands, catchment characteristics, and the vulnerability of settlements. Likewise, agricultural planning should consider soil conservation, water availability, biodiversity, and long-term productivity rather than focusing solely on immediate yields. Such applications are contemporary policy interpretations of Daoist thought, and should be guided by established ecological science and evidence-based environmental planning (IPCC, 2022; Miller, 2017).

6.2. Ziran: Naturalness and spontaneity

Ziran is usually translated as naturalness or spontaneity, and refers to the idea of being so of oneself, and not unnecessarily shaped by external compulsion. In environmental interpretation, the principle encourages respect for natural processes, and caution about interventions that disregard the characteristics of particular ecosystems. Zhang (2023) argues that ziran can contribute to a contemporary environmental ethic, when interpreted in relation to ecological diversity, and the rejection of destructive attitudes toward the natural world (Moeller, 2015; Zhang, 2023). In Nigeria, Ziran could guide restoration programmes that support native vegetation, protect wetlands, encourage natural regeneration where appropriate, and conserve habitats. Restoration strategies should be adapted to local ecological conditions, and not apply uniform interventions to different landscapes. Nevertheless, naturalness does not imply that human intervention is always undesirable: polluted land, damaged waterways, and vulnerable settlements may require active remediation and protection. The principle is therefore best applied as a call for ecologically informed, and proportionate intervention, and not passive acceptance of environmental degradation (UNEP, 2011; Zhang, 2023).

6.3. Wu wei: Non-forcing action and responsive intervention

Wu wei is often translated as non-action, but interpreting it as complete passivity can obscure the philosophical importance of this principle. In contemporary interpretations, it can refer to action that avoids unnecessary force, excessive control, and inappropriate interference. Daoist scholarship stresses that wu wei should be understood in its wider philosophical context, and not as a simple rejection of purposeful action (Moeller, 2015; Zhang, 2023). Applied to environmental governance in Nigeria, wu wei could encourage preventive, adaptive, and participatory interventions to address underlying causes of environmental damage. For instance, reducing unsustainable forest exploitation may require not only enforcement, but community forestry, accessible alternative energy, environmental education, and livelihood support. However, the principle cannot be used to excuse regulatory neglect, or failure to protect affected communities. Pollution, illegal dumping, and

destructive extraction may require investigation, sanctions, restoration, and compensation in accordance with applicable law (Ogunkan, 2022; UNEP, 2011; Zhang, 2023).

6.4. Pu: Simplicity and the uncarved block

The Daoist concept of pu, commonly described as the uncarved block, typifies simplicity and potential, unburdened by excessive artificial complication. In contemporary environmental ethics, this principle can be interpreted as a challenge to the notion that unlimited consumption and material accumulation necessarily constitute progress. This interpretation is consistent with wider Daoist discussions of how human flourishing can be reconsidered in relation to ecological well-being and consumption patterns (Laozi, 2003; Miller, 2017). In Nigeria, this principle could promote waste reduction, repair and reuse, recycling, composting, resource efficiency, and more sustainable purchasing decisions. Schools, households, markets, businesses, and public institutions could incorporate such practices into environmental management programmes. Nevertheless, simplicity cannot be used to justify depriving disadvantaged populations of essential services or opportunities. The appropriate objective is to reduce avoidable waste and excessive consumption, and enable people to meet legitimate needs via environmentally-responsible systems (United Nations, 2015; World Commission on Environment and Development, 1987).

6.5. Humility and moderation

Humility and moderation are important themes in Daoist critiques of arrogance, excessive ambition, and the pursuit of domination. In environmental governance, these values can be interpreted as ethical restraints on the exercise of political and economic power. They encourage decision-makers to acknowledge uncertainty, consider the consequences of their actions, and not assume that immediate economic benefits outweigh ecological costs (Laozi, 2003; Miller, 2017).

For Nigeria, moderation could guide responsible extraction of petroleum and mineral resources, sustainable agricultural expansion, forest management, and industrial production. Humility could encourage public officials and businesses to listen to affected communities and independent environmental experts, prior to making decisions with substantial ecological consequences. These values should be articulated as transparent impact assessments, public consultation, monitoring, and enforceable standards, so that ethical commitments produce practical accountability (Ogunkan, 2022; UNEP, 2011).

6.6. Harmony and relational balance

Harmony in Daoist thought should not be interpreted as the absence of disagreement. Its contemporary environmental significance is in encouraging relationships that avoid unnecessary domination, and support the continuing flourishing of the human and natural worlds. Daoist environmental scholarship relates such relational perspectives to the possibility of reconsidering how human societies understand ecological responsibility and collective well-being (Cooper, 2014; Miller, 2017). In Nigeria, an ethic of relational harmony could guide cooperation among farmers, pastoralists, fishers, industries, host communities, traditional institutions, and government agencies, over shared natural resources. Participatory resource governance can provide opportunities for stakeholders to exchange information, negotiate competing interests, and establish transparent arrangements for resource use. However, genuine harmony requires fairness, accountability, and the protection of

rights; it cannot be accomplished by asking affected communities to remain silent about pollution, exclusion, or injustice (Ogunkan, 2022; United Nations, 2015).

7. Application of Daoist Principles to Environmental Protection in Nigeria

7.1. Pollution prevention and ecosystem restoration

Environmental pollution can damage public health, ecosystems, and the livelihoods of land and water-dependent people. Nigeria's Ogoniland experience illustrates the extent to which oil production can pollute the environment and the need for appropriate assessment and remediation. The Daoist principles of moderation and humility can be used to reinforce the ethical case that economic production should not be pursued unless its social and ecological consequences have been adequately considered (UNEP, 2011; Miller, 2017). Their practical application to oil production and other industries involves pollution prevention, reliable monitoring, environmental remediation, and corporate accountability. Oil companies should meet relevant standards, while public agencies should investigate environmental offences and ensure that remediation measures address identified risks. Daoist principles cannot replace these legal and technical obligations but can strengthen the ethical case for responsible production and the prevention of unnecessary harm (Ogunkan, 2022; UNEP, 2011).

7.2. Deforestation, biodiversity, and sustainable agriculture

Deforestation and degradation can damage biodiversity, soil quality, watershed functions, and the resilience of agricultural landscapes. Daoist naturalness and moderation provide ethical grounds for questioning resource exploitation that ignores ecological limits. Miller (2017) examines Daoist environmental thought in the context of reassessing humanity's relationships with nature, while Zhang (2023) discusses how ziran and wu wei can be interpreted to challenge destructive attitudes towards ecological diversity (Miller, 2017; Zhang, 2023). Their application to Nigerian agricultural communities might involve developing agroforestry, soil conservation, sustainable harvesting, riparian vegetation protection, and land restoration measures, which should be informed by agricultural extension services, appropriate scientific research, and economic incentives. Traditional and modern methods should be considered according to their environmental impacts and applicability rather than being assumed to be intrinsically sustainable or harmful (IPCC, 2022; World Commission on Environment and Development, 1987).

7.3. Climate change adaptation and disaster-risk reduction

Climate change threatens food systems, water supply, infrastructure, and public health, with its impacts determined by exposure and vulnerability. The IPCC (2022) highlights the importance of understanding interactions between climatic, socioeconomic, and adaptation factors. Daoist humility and wu wei can complement climate adaptation by encouraging recognition of uncertainty, adaptability, and caution against rigid interventions that ignore local circumstances (IPCC, 2022; Zhang, 2023). They could be applied to Nigerian agricultural communities, watershed protection, early-warning systems, flood preparedness, and other climate adaptation activities while taking care not to interpret them as a justification for accepting preventable disasters or shifting responsibility from public authorities and major polluters to vulnerable populations. Climate adaptation requires scientific research, funding, infrastructure, and accountability, while Daoist principles provide an additional ethical basis for such measures (IPCC, 2022; United Nations, 2015).

7.4. Waste management and sustainable consumption

Inadequate waste management can lead to pollution, degradation, and public health risks. The United Nations (2015) highlights responsible consumption and production as important components of sustainable development, which makes waste prevention and resource efficiency relevant policy priorities. Daoist pu, interpreted as an ethic of simplicity and restraint, can be used to critically examine consumption patterns that lead to avoidable waste and unnecessary environmental costs (Laozi, 2003; United Nations, 2015). Their application could involve waste separation and recycling, composting, repair and reuse, reduced packaging, and public awareness, but these measures will only be effective if households and businesses have reliable collection and disposal services, producer responsibility, and enforcement mechanisms. Daoist-inspired environmental education should be complemented by investment and institutional arrangements that allow households and businesses to reduce their waste (Ogunkan, 2022; United Nations, 2015).

7.5. Environmental education and public awareness

Environmental education can facilitate the translation of ethical principles into everyday decisions concerning resource use, pollution prevention, and conservation. Daoist concepts can be integrated into environmental extension education, teacher training, community workshops, and youth programmes to encourage reflection on ecological interdependence, moderation, and the consequences of excessive intervention. Contemporary scholarship on Daoist environmental thought can provide a foundation for presenting these concepts as resources for comparative environmental ethics rather than as a complete environmental policy system (Cooper, 2014; Zhang, 2023). Their application to Nigerian populations would involve using easily accessible languages, context-specific examples, and participatory methods, and comparing Daoist perspectives with relevant Nigerian indigenous knowledge systems and other philosophical or religious views on environmental responsibility. Such programmes should respect religious and cultural diversity and be evaluated based on changes in knowledge, attitudes, environmental practices, and outcomes rather than number of participants or hours spent (Miller, 2017; United Nations, 2015).

8. Daoist Philosophy, Sustainable Development, and Peaceful Coexistence

8.1. Environmental justice and equitable resource governance

Environmental justice is concerned with the distribution of environmental benefits and burdens, the representation of affected populations, and the treatment of communities exposed to environmental risks. Nigeria's experiences illustrate the importance of institutional accountability and public participation in environmental decision-making. Ogunkan (2022) identifies governance shortcomings and stakeholder participation as impediments to sustainable environmental management, while the Ogoniland assessment illustrates the importance of addressing environmental contamination for affected communities (Ogunkan, 2022; UNEP, 2011). Daoist humility and moderation can reinforce the ethical case for transparent resource governance and responsible power use. In practice, these principles could be used to promote consultation, access to information, fair procedures for redress, and appropriate remediation if environmental damage occurs. Their application must nevertheless be grounded in enforceable obligations and rights rather than relying on the goodwill of powerful actors alone (Miller, 2017; Ogunkan, 2022).

8.2. Natural-resource conflicts and peaceful coexistence

Competition over land, water, grazing areas, forests, and fisheries can contribute to tensions when resource access is disputed or governance arrangements perceived as unfair. However, the relationship between environmental stress and conflict is complex, and outcomes depend on institutions, inequality, political conditions, livelihood security, and availability of peaceful dispute-resolution mechanisms. The IPCC (2022) situates climate-related risks within broader social and institutional conditions rather than treating environmental pressures as automatic causes of violence (IPCC, 2022). Daoist principles of wu wei, humility, and harmony may provide ethical foundations for dialogue, mediation, and collaborative resource management. For instance, disputes over shared water sources or land-use conflicts could be addressed using inclusive consultations, transparent agreements, joint monitoring, and accessible grievance procedures. Nevertheless, mediation should not undermine legal rights or be used as an excuse for coercion, environmental offences, or violence. Peaceful coexistence requires both nonviolent engagement and institutional accountability (Cooper, 2014; Ogunkan, 2022).

8.3. Intergenerational responsibility

Intergenerational responsibility entails present societies protecting the ecological and social conditions required for future generations to meet their needs. The World Commission on Environment and Development (1987) places intergenerational responsibility at the heart of sustainable development, while the United Nations (2015) identifies long-term environmental protection as an integral part of global development commitments. Daoist moderation and humility can complement these principles by challenging excessive exploitation for short-term economic gain (Laozi, 2003; World Commission on Environment and Development, 1987). Their application to Nigerian environmental issues could involve decision-making concerning petroleum extraction, forestry, urban expansion, agricultural land, and waste. Environmental impact assessment, pollution prevention, restoration planning, and long-term monitoring can help ensure that current development decisions take account of future ecological and social costs. Daoist principles provide an ethical rationale for restraint while public institutions and scientific assessment provide the practical mechanisms needed to protect future generations (Miller, 2017; United Nations, 2015).

8.4. Community participation and social cohesion

Community participation can improve environmental decision-making by incorporating local knowledge, identifying practical needs, and giving affected populations opportunities to influence interventions. In Nigeria, effective environmental governance requires coordination between public agencies, civil society, industries, traditional institutions, and communities, especially where resource management crosses administrative and livelihood boundaries. Ogunkan (2022) identifies stakeholder participation and institutional coordination as important considerations for improving environmental governance (Ogunkan, 2022). Daoist attentiveness to context and resistance to excess can contribute to participatory approaches that recognize local experience and encourage cooperation. Community-based conservation, watershed management, waste reduction, and climate adaptation can provide opportunities for joint social groups, but such participation must be meaningful and include access to information, opportunities to influence decisions, and mechanisms for challenging unfair outcomes (Miller, 2017; Ogunkan, 2022).

9. Strategies for Incorporating Daoist Principles into Environmental Governance in Nigeria

9.1. Environmental policy and institutional accountability

Environmental agencies and public institutions should promote the implementation of environmental standards by ensuring transparency in monitoring, credible impact assessments, access to information, and effective enforcement. Daoist moderation can provide an ethical rationale for refusing decisions that prioritise short-term benefits while ignoring long-term ecological consequences. However, the efficacy of environmental governance depends on institutional resources, coordination, accountability, and enforceable legal requirements (Ogunkan, 2022; UNEP, 2011). Coordination between agriculture, forestry, water management, urban development, public health, and other sectors is also crucial, given the transversal nature of many environmental problems. It enables the reduction of conflicting policy decisions and a better alignment of development planning with ecological protection. Daoist philosophy can contribute ethical guidance to this process, but institutional reforms and evidence-based planning remain indispensable (Ogunkan, 2022; United Nations, 2015).

9.2. Environmental extension education

Universities, schools, agricultural extension services, and civil society organisations should consider incorporating comparative environmental ethics into their educational programmes. Daoist principles can be elucidated through relevant local examples, such as pollution prevention, soil conservation, sustainable consumption, and responsible resource use. Such education should present Daoism as one philosophical perspective that can be critically examined alongside other ethical traditions, rather than a belief system that all Nigerians must accept (Cooper, 2014; Zhang, 2023). Environmental extension programmes should combine ethical discourse with demonstrations, community problem-solving, and the evaluation of environmental practices. For example, participants could assess local waste management issues, identify sources of soil degradation, or develop community conservation activities. Evaluations should examine whether these programmes improve environmental knowledge, behaviour, and ecological outcomes, distinguishing between educational intentions and demonstrated effects (Ogunkan, 2022; United Nations, 2015).

9.3. Integration with Nigerian indigenous ecological knowledge

Nigeria's diverse communities possess different forms of indigenous ecological knowledge, local environmental practices, and cultural understandings of resource responsibility. Daoist philosophy should be presented through comparative analysis, rather than presented as a replacement for these traditions. Such an approach can allow an examination of shared concerns about restraint, communal responsibility, ecological relationships, and intergenerational care, without assuming that different philosophical traditions are identical (Cooper, 2014; Miller, 2017). Participatory research can help identify local practices that remain ecologically useful, assess those that may have become unsustainable, and examine how traditional knowledge can complement scientific evidence. Researchers should acknowledge differences between communities and respect the rights of knowledge holders. Their objective should be context-sensitive environmental governance that combines ethical reflection, local experience, scientific assessment, and institutional accountability (IPCC, 2022; Ogunkan, 2022).

9.4. Sustainable business and responsible production

Businesses operating in petroleum, mining, agriculture, manufacturing, construction, and other resource-intensive sectors should be encouraged and, where applicable, required to prevent pollution, reduce waste, conserve resources, and disclose relevant environmental risks. Daoist moderation and humility can strengthen the ethical argument for responsible production, but implementation depends on clear standards, credible auditing, monitoring, and appropriate enforcement (Miller, 2017; UNEP, 2011). Public procurement and investment decisions may also take account of environmental performance, product durability, resource efficiency, and lifecycle costs. These can enable a development pathway in which economic activity contributes to human well-being without imposing avoidable ecological damage. This approach is consistent with the sustainable consumption and production objectives of the United Nations (2015) and the long-term development principles articulated by the World Commission on Environment and Development (1987).

9.5. Peacebuilding and environmental mediation

Environmental dispute-resolution mechanisms should ensure accessible grievance procedures, opportunities for early dialogue, impartial mediation where appropriate, and legal redress pathways. Daoist wu wei may influence non-coercive engagement and responsive negotiation, while the emphasis on relational balance can encourage cooperation among groups that share natural resources. Such mechanisms may be particularly useful where combined with transparent resource-use arrangements and community participation (Cooper, 2014; Ogunkan, 2022). Nevertheless, environmental mediation must be within the framework of law and human rights. Dialogue should not silence legitimate grievances, excuse environmental violations, or coerce affected communities to accept unjust outcomes. Where serious offences or violence occur, appropriate investigation and legal processes are essential. Ethical dialogue and institutional accountability should therefore be considered as complementary components of peaceful coexistence (IPCC, 2022; Ogunkan, 2022).

10. Critical Limitations and Challenges

Although Daoist philosophy may offer valuable ethical insights, its application to Nigeria presents conceptual and cultural challenges. Daoism was developed in a different historical and cultural context, and its concepts cannot be directly transferred into Nigerian society. Nigeria's religious, linguistic, ethnic, and ecological diversity requires context-sensitive adaptation, while contemporary Daoist scholarship itself recognises the need to reconstruct classical concepts for modern environmental questions (Miller, 2017; Zhang, 2023). A second limitation is the possible misinterpretation of wu wei as passivity. Such an interpretation could hinder urgent environmental action where pollution prevention, ecological restoration, or the protection of vulnerable communities require decisive intervention. Zhang (2023) argues that ziran and wu wei need not entail passive acceptance of environmental destruction, while Cooper (2014) similarly warns against simplistic interpretations of Daoism as a demand to abandon modern life. These concepts should therefore inform proportionate and ecologically responsive action, rather than justify inaction (Cooper, 2014; Zhang, 2023). A third limitation is that ethical education alone cannot resolve structural weaknesses in environmental governance. Where environmental harm arises from weak enforcement, inadequate infrastructure, institutional fragmentation, or unequal resource access, philosophical reflection must be combined with practical reforms and material support. Ogunkan (2022) identifies institutional and

legal weaknesses as barriers to effective environmental management in Nigeria, reinforcing the need to connect ethical arguments with governance reforms (Ogunkan, 2022; UNEP, 2011).

A fourth concern is the possibility that appeals to harmony may suppress legitimate disagreements or reinforce existing inequalities. Peaceful coexistence cannot be achieved through requiring communities to tolerate pollution, exclusion, or violations of their rights. Genuine environmental harmony requires fair procedures, accountability, community participation, and appropriate remedies for environmental harm. Daoist principles are therefore most defensible, when interpreted in ways that promote justice and responsible relationships, rather than silence or submission (IPCC, 2022; United Nations, 2015). Finally, this paper is a conceptual position paper and does not present original empirical evidence demonstrating that Daoist-informed interventions have reduced pollution or conflict in Nigeria. Its conclusions should therefore be understood as reasoned philosophical and policy arguments, rather than established causal findings. Further research could examine whether Daoist-informed environmental education affects conservation practices, whether moderation-oriented campaigns influence waste generation, and whether participatory approaches informed by non-forcing action improve resource governance and community cooperation (Cooper, 2014; Ogunkan, 2022; Zhang, 2023).

11. Conclusion

This position paper argues that Daoist philosophy offers valuable ethical insights for enhancing environmental protection and fostering sustainable development in Nigeria. Key principles such as Dao, ziran, wu wei, pu, humility, moderation, and harmony can facilitate a deeper understanding of the connections between ecological systems, excessive consumer behaviors, and the impacts of development policies that overlook environmental and social repercussions. While these philosophical ideas do not replace the need for environmental science or legislation, they can reinforce the ethical foundations driving these interventions. For instance, the concept of naturalness can instill a respect for ecological processes, while moderation encourages responsible consumption. Humility promotes accountability and community involvement, and the principle of non-forcing action can enhance environmental governance. In Nigeria, applying these Daoist principles relates to pollution prevention, ecosystem restoration, sustainable agriculture, climate adaptation, and effective waste management. It is essential to respect cultural diversity, integrate indigenous ecological wisdom, safeguard the rights of affected communities, and ensure institutional accountability in these endeavors. Environmental harmony should not be a means to silence voices advocating for justice, and the idea of non-forcing action must not excuse regulatory lapses. Ultimately, Daoist philosophy presents a supplementary ethical framework that supports a more ecologically responsible and socially inclusive development path in Nigeria. Its efficacy will hinge on context-sensitive interpretations and its integration with scientific and local knowledge, leading to accountable policies and practical actions. This holistic approach aims to promote ecological integrity, intergenerational responsibility, and peaceful coexistence within communities. Further exploration is needed to assess how Daoist-informed methods can improve environmental practices and enhance community relationships effectively.

12. Recommendations

1. To incorporate environmental ethics into formal and non-formal education, with appropriate programmes for educational institutions and environmental extension agencies that would include comparative analyses of Daoist principles, indigenous knowledge systems, and other relevant philosophies. The application of philosophical concepts in environmental education and training has the potential to increase environmental knowledge and responsibility, and to demonstrate their relevance.
2. To enhance community environmental governance by promoting community participation in decision-making on land, water, forests, waste, and other matters affecting the local environment, through access to information, accountability mechanisms, and grievance structures.
3. To promote preventative and proportionate environmental interventions through the reinterpretation of wu wei to include early intervention, scientific auditing, public education, and appropriate law enforcement measures, as well as to ensure the regulatory and supervisory role of governments and industries in preventing and remedying environmental damage.
4. To promote temperance and restraint in resource use and exploitation, by promoting resource productivity and waste avoidance at all levels: government, industry, households, and businesses, and to support adherence to the principles of sustainable consumption and production and responsible resource use and exploitation compatible with environmental sustainability.
5. To give effect to environmental accountability through effective implementation, transparent reporting, auditing, sanctions, and remedial actions, where relevant legal frameworks, investigative mechanisms, and enforcement agencies should be empowered and adequately resourced to enforce environmental regulations and take remedial action; the experience of Nigeria further highlights the importance of institutional coherence and effectiveness.
6. To promote deliberative consultation in natural resource governance to prevent conflict by ensuring appropriate dispute settlement mechanisms and consultation processes, including negotiations on resource-use issues and community participation in decision-making, and to ensure respect for legal and policy frameworks and due process, while addressing the root causes of conflicts.
7. To promote contextual ecological restoration by including scientific, natural, and human-assisted restoration methods and measures, and by ensuring community participation, as appropriate, in restoring degraded ecosystems and balancing short-term and long-term environmental goals, according to the state of the environment and the needs of the communities.
8. To promote intergenerational equity in environmental planning and decision-making to ensure that future generations are not disadvantaged through the unnecessary use of natural resources, through cost-benefit assessments that take account of long-term environmental consequences and the integration of environmental considerations into development planning and economic decision-making processes at all levels.
9. To conduct empirical studies to determine the role of Daoist-informed environmental education and governance in influencing environmental behaviour and community partnerships and in promoting environmental conservation, by encouraging universities and other relevant institutions to undertake field studies and pilot projects to determine the extent to which the philosophical arguments advanced in this paper are borne out in practice.
